

INVESTOR BRIEF · CONFIDENTIAL

DinnerTime

Open the fridge. Take a photo. Get dinner.

The AI that ends the 6pm cognitive cliff.

30 sec

US HOUSEHOLDS ASKING
"WHAT'S FOR DINNER?"

The 5-Day-a-Week Tax

Every household hits the same wall at 6pm: **"What do we have? What do we make? Where's the list?"** It's not a recipe problem — it's a *decision* problem, repeated 260 times a year. Meal-kit services charge \$120/week to remove it. Recipe apps don't solve it. DinnerTime does.

The Magic Loop

- 1 Snap** — one photo of the fridge or pantry shelf.
- 2 Claude Vision** identifies every item, auto-routes to fridge/freezer/pantry, dedupes against what's already there.
- 3 Suggest** — 3 dinners you can actually make, ranked by what uses up what's expiring.
- 4 Plan** — tap once, 7-day meal plan populated.

- 5 **Order** — missing items auto-forwarded to Instacart. Cart is pre-built.
- 6 **Cook** — hands-free voice guidance walks you through it, no screen taps with greasy hands.

Zero mental effort from "what do we have?" to "what should we cook?"

Why Now

- **Vision-class AI got cheap.** Claude Sonnet 4 identifies ingredients from a blurry fridge shot at ~\$0.003/scan. Two years ago this was a research paper.
- **Instacart opened its API.** Link-based cart injection means zero fulfillment risk — we're a demand-gen layer, they close the loop.
- **On-device speech** finally works well enough for hands-free cooking without a cloud round-trip.
- **Meal-kit fatigue.** HelloFresh / Blue Apron churn is at all-time highs. Consumers want the cognitive relief without the \$12/meal premium.

Technical Moat

AI VISION

Single-shot pantry capture — Claude vision model parses every item in one photo. No bounding-box UX, no "scan each item" friction.

SEMANTIC DB

Canonical ingredient graph on pgvector — "organic chicken breast" and "chicken breast" merge into one pantry row. 366 canonical ingredients, 1,587 aliases shipped. Admin-promoted from aggregate scan data.

PERSONALIZATION

Learned placement rules — app observes user overrides ("milk goes in fridge") and suggests rules after 3 repetitions. Aggressive auto-accept for user-flagged "staples" (milk, eggs) even on low-confidence scans.

VOICE

On-device STT + Claude + TTS pipeline for cooking mode. No wake-word latency, works without signal, privacy-friendly.

ARCHITECTURE

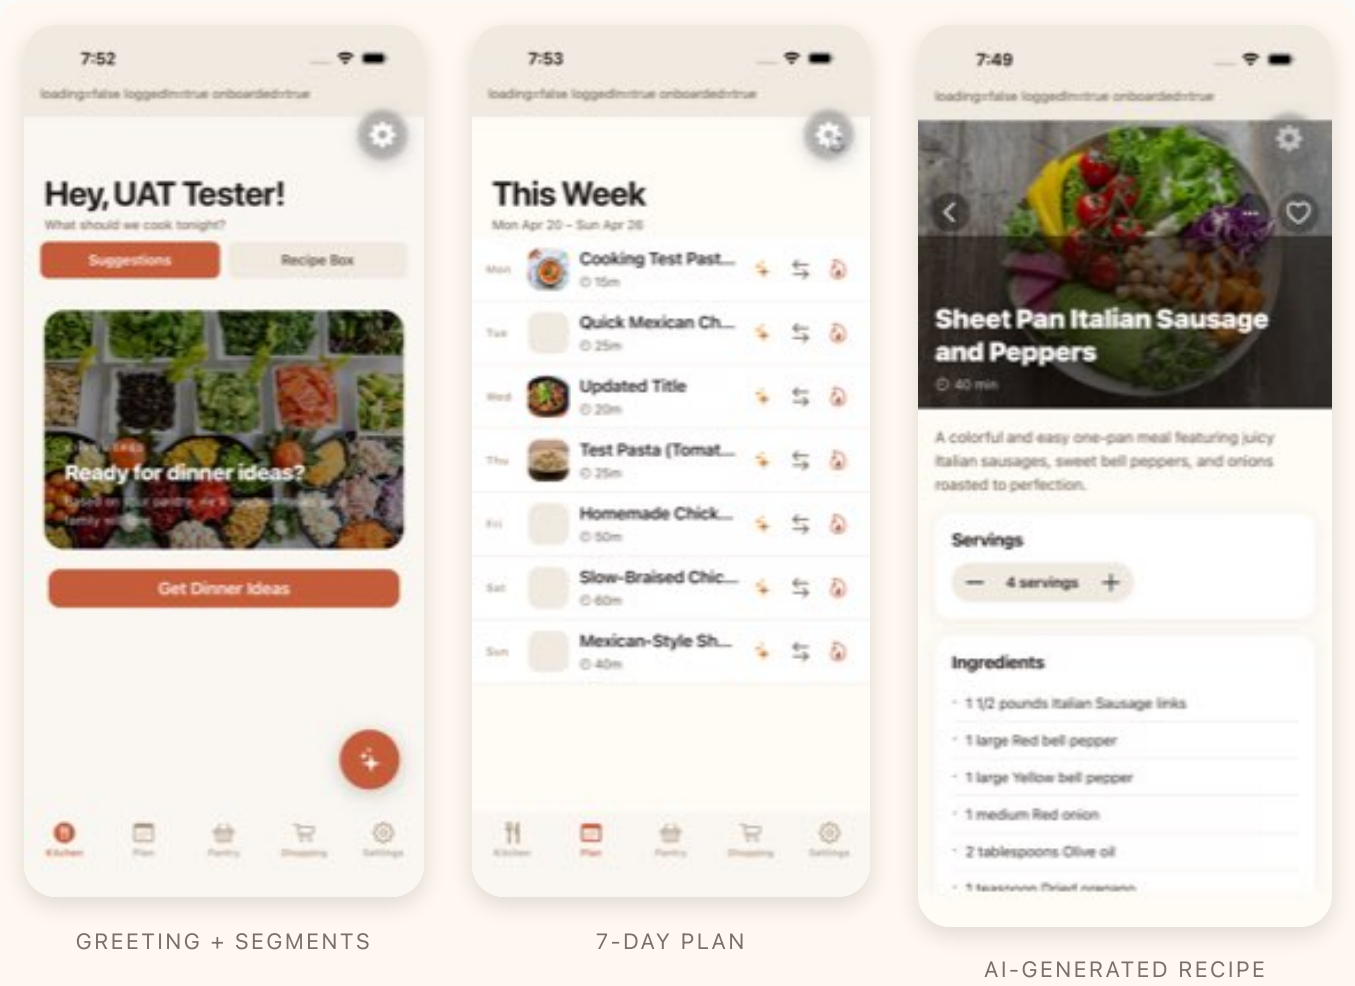

Zero-key mobile — all AI/Instacart calls go through our Hono backend proxy. No API keys exposed, full spend control, eval harness for prompt regressions. Supabase handles

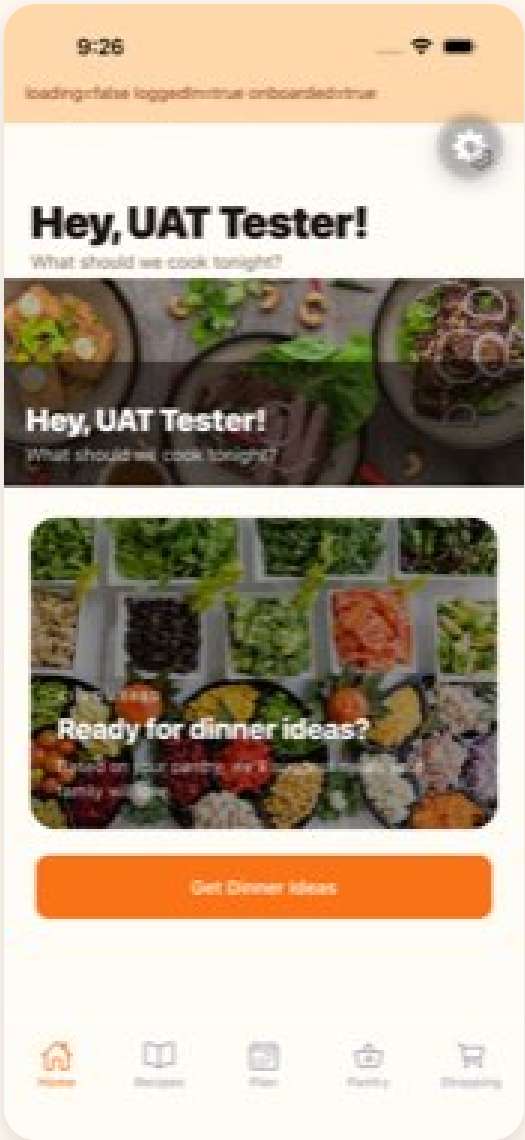

auth/storage/realtime in one dependency.

PANTRY + SCAN

HOUSEHOLD PREFERENCES

Business Model

PRIMARY — SUBSCRIPTION

\$6.99/mo or \$49/yr for unlimited scans, full meal planning, voice cooking. Free tier caps at 3 scans/week.

SECONDARY — AFFILIATE

Instacart revenue share on first-order + margin on recurring carts. Zero inventory, zero fulfillment risk.

Shipped & Shippable

- ✓ iOS dev build, full auth + Supabase schema (19 migrations)
- ✓ Photo-to-pantry with AI auto-location + duplicate dedup

- ✓ 7-day meal planning, swap & regenerate
- ✓ Shopping list → Instacart cart link
- ✓ Staples + learned-rules pantry intelligence
- ✓ 27-flow Maestro UAT suite (simulator + physical device)

Next: voice-cooking GA · private beta (50 households) · App Store submission

The Opportunity

We are raising a seed round to fund **launch + 6 months of growth**. Capital accelerates:

- App Store launch & paid acquisition in 3 beachhead metros
- Android build-out (Expo gives us this cheaply)
- Recipe corpus expansion + cuisine-specific fine-tuning
- Retail partnerships beyond Instacart (Amazon Fresh, Kroger)
